Data available since: 1/1/2015

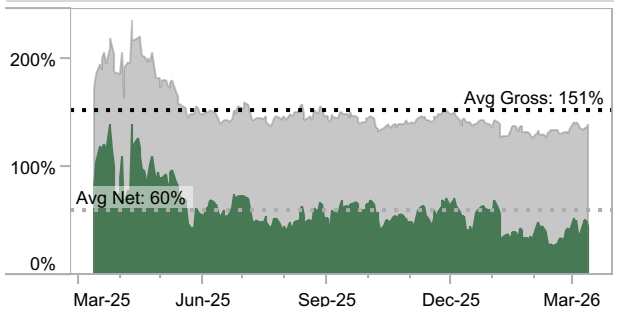
Sharpe Ratio: *Annualized excess return over benchmark / annualized volatility. A measure of reward per unit of risk. Three month LIBOR is used as the risk free benchmark in the calculation.*

Sortino Ratio: *A variant of the Sharpe Ratio that uses downside volatility rather than total volatility as a risk measure so as to avoid penalizing managers for positive performance. Three month LIBOR is used as the risk free benchmark in the calculation.*

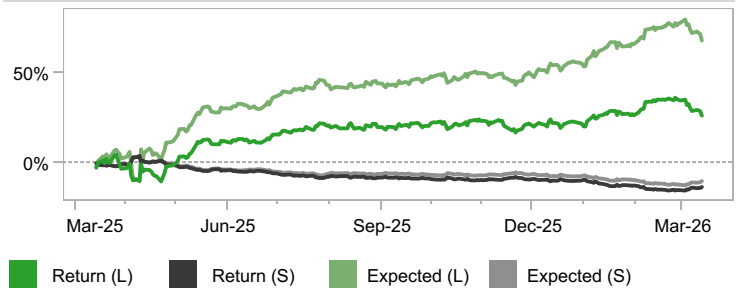
Gross/Net Exposure: *This is the delta adjusted exposure.*

Expected Return: *The portfolio return required to justify its market risk (cumulative statistic of daily XLI return x daily portfolio beta)*

Gross/Net Exposure



Actual vs. Expected Return against XLI (Trailing 12M)



Fund vs Index Return (Trailing 12M)

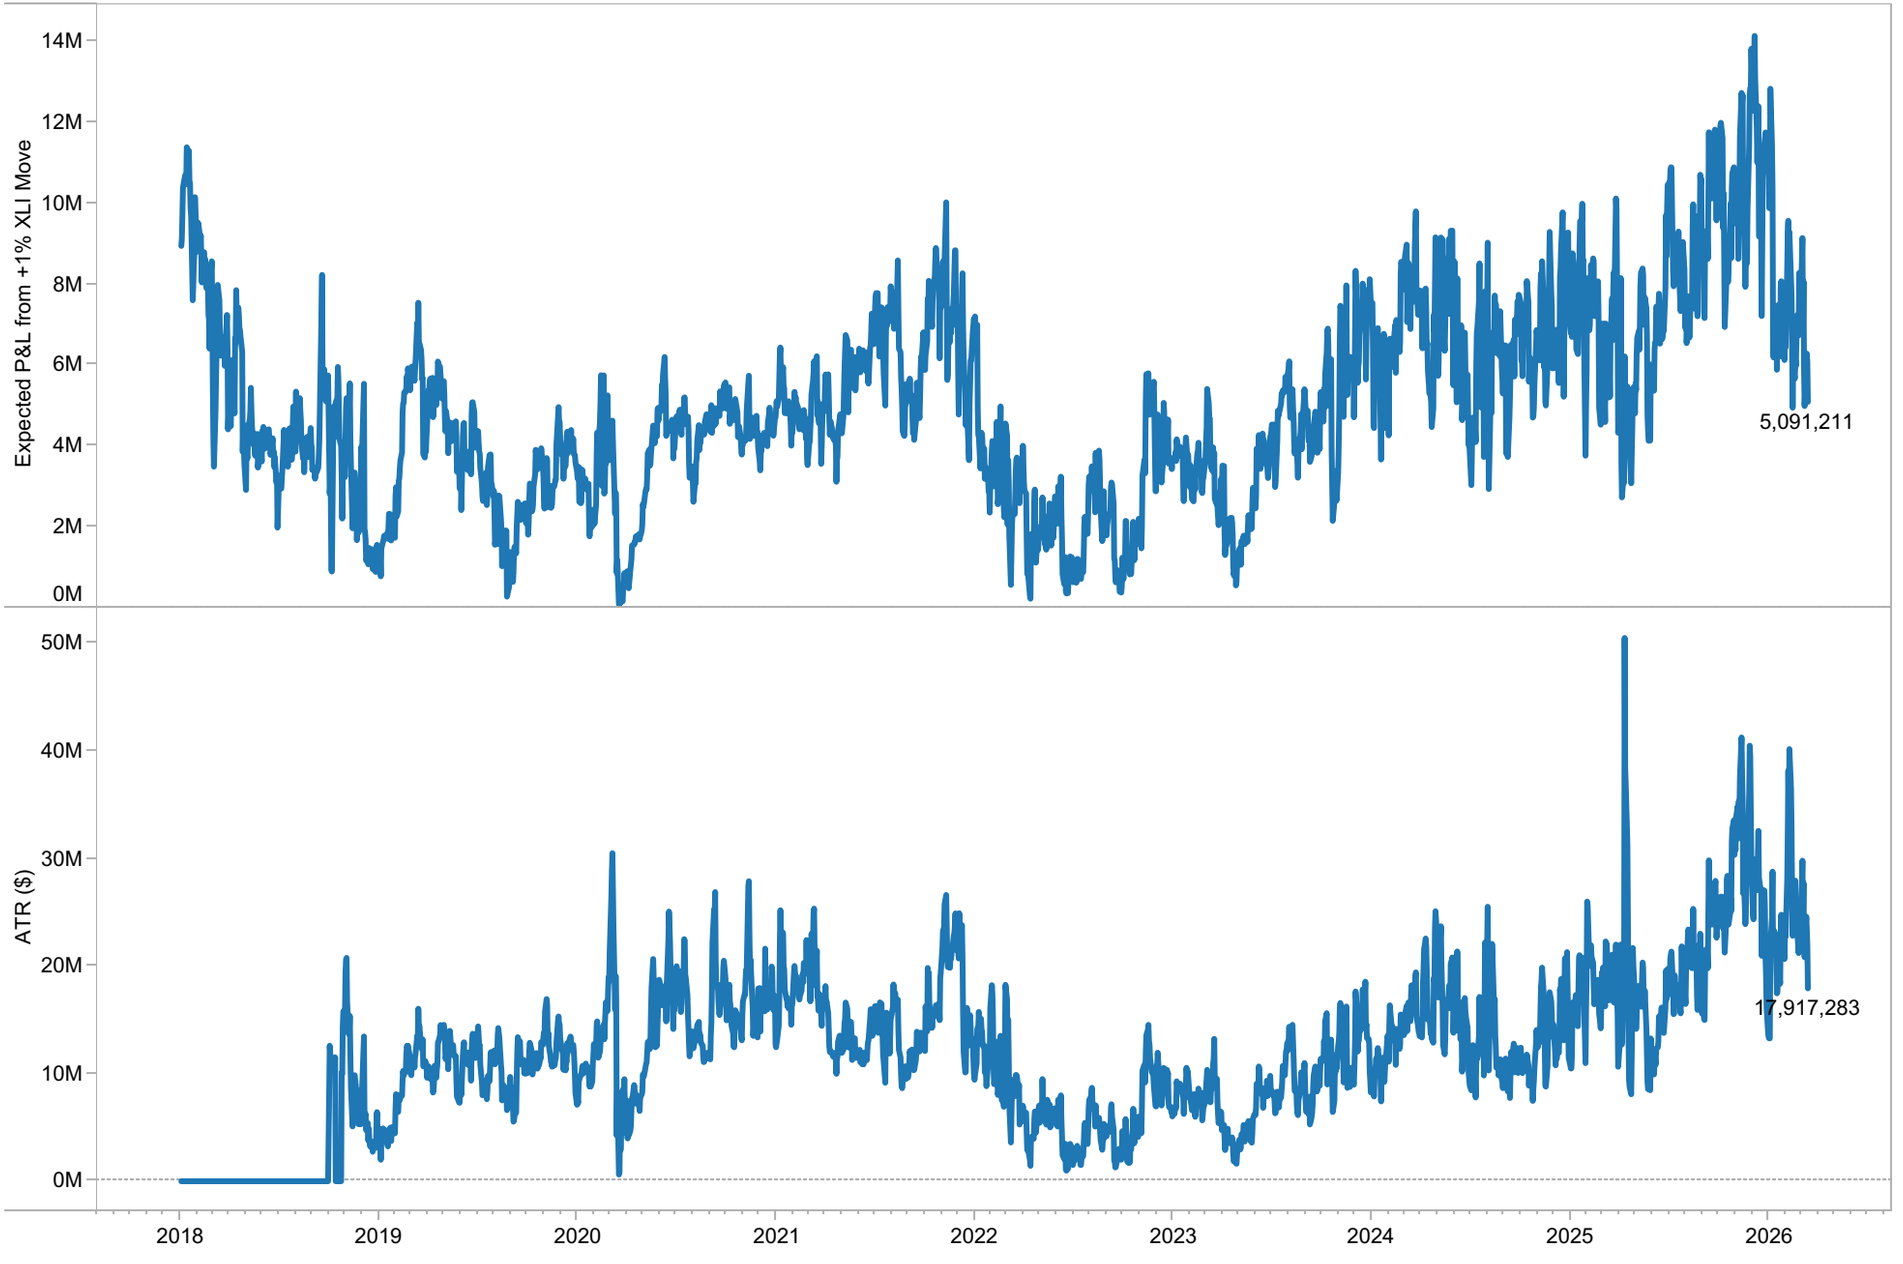
Net: This is delta adjusted exposure.
5-Day Average True Range: This is calculated by taking the max of three measures (percent change from current low to current high, the absolute value of the percent chanage from the previous close to the current high and the absolute value of the percent change from the previous close to the current low) for the trailing 1 week then taking the average.
At Risk: This equals Net times ATR. **# of Day Moves**: This equals Live to Date P&L divided by $ at risk.

End Date 3/12/2026

Expected Move on +1% Change in XLI & ATR History



Expected move is calculated based on end of day beta delta adjusted exposure to XLI. This is used to predict move on 1% change in XLI on the next trading day. 1-year beta is used in calculation.

Average true range (ATR) is taking the average daily true range of all underlying securities in the portfolio.

Long Short

Securities are grouped into growth and value based on their 3m correlation to the MSQQUGRL, MSQQUVLLL swaps.
MSQQUGRL: Positions with correlation greater than 0.4 are grouped as 'Growth' and less than -0.4 as 'Value'
MSQQUVLLL: Positions with correlation greater than 0.4 are grouped as 'Value' and less than -0.4 as 'Growth'
Securities with mismatch between tagging based on MSQQUGRL, MSQQUVLLL are categorized based on the higher correlation magnitude to the swaps.

Net: This is delta adjusted exposure.
5-Day Average True Range (ATR): This is calculated by taking the max of three measures (percent change from current low to current high, the absolute value of the percent chanage from the previous close to the current high and the absolute value of the percent change from the previous close to the current low) for the trailing 1 week then taking the average.
At Risk: This equals Net times ATR
At Risk Change = Change From Exposure Change + Change From 5-day ATR Change + Interaction Effect,
Change from Exposure = ATR as of start day * change in net exposure
Change from 5-day ATR = Net as of start day * change in ATR
Interaction Effect (Chg from both Exp and ATR) = change in net exposure * change in ATR
